AMENDMENTS TO THE CLAIMS

Please amend the claims as follows.

- 1. (Currently Amended) A network system providing integration, comprising:
 - a client computer;
 - a server;
 - a server-side cryptographic function providing cryptographic services located on the server;
 - a PKI-Bridge providing an interface between the server and the server-side cryptographic function;
 - a remote access switch providing an interface between the client computer and the server;
 - a client-side cryptographic function providing cryptographic services located on the client computer;
 - a dial-up client providing dialing services to access for dialing the remote access switch; and a custom script dynamically linked library providing an interface between the dial-up client and the client-side cryptographic function,
 - wherein the dial-up client is an executable file that loads and executes code in the custom script dynamically linked library, and wherein
 - the server-side cryptographic function generates a challenge string,
 - the client-side cryptographic function generates a signed response string in response to the challenge string,
 - the custom script dynamically linked library encodes and divides the signed response string to obtain a plurality of packets,
 - the PKI-Bridge combines and decodes the plurality of packets to obtain a reconstructed signed response string, and
 - the server-side cryptographic function verifies the reconstructed signed response string to generate a result; and
 - the server-side cryptographic function sends an instruction based on the result to the server via the PKI-Bridge, wherein the instruction specifies whether the server should send an allow connection message to the remote access switch.

(Previously Amended) The network system of claim 1, further comprising:
 a security device holding authentication information; and
 a security device reader attached to the client computer for reading the security device.

- 3. (Original) The network system of claim 2, wherein a certificate is stored on the security device.
- 4. (Original) The network system of claim 2, wherein the security device is a smart card.
- (Original) The network system of claim 1, further comprising:a directory service accessed by the server-side cryptographic function.
- 6. (Original) The network system of claim 5, wherein the directory service is lightweight directory access protocol compliant.
- 7. (Original) The network system of claim 1, wherein the client-side cryptographic function and the server-side cryptographic function employ the same cryptographic scheme.
- 8. (Previously Presented) The network system of claim 1, wherein the server-side cryptographic function uses a random number generator to generate the challenge string.
- 9. (Previously Presented) The network system of claim 1, wherein a client-side cryptographic function uses a random number generator to generate the signed response string.
- 10. (Cancelled)
- 11. (Cancelled)
- 12. (Cancelled)
- 13. (Original) The network system of claim 1, wherein the dial-up client operates in terminal mode.

- 14. (Currently Amended) A network system providing integration, comprising:
 - a client computer;
 - a server;
 - a server-side cryptographic function providing cryptographic services located on the server;
 - a PKI-Bridge providing an interface between the server and the server-side cryptographic function;
 - a remote access switch providing an interface between the client computer and the server;
 - a client-side cryptographic function providing cryptographic services located on the client computer;
 - a dial-up client providing dialing services to access for dialing the remote access switch;
 - a custom script dynamically linked library providing an interface between the dial-up client and the client-side cryptographic function,
 - wherein the dial-up client is an executable file that loads and executes code in the custom script dynamically linked library;
 - a security device holding authentication information;
 - a security device reader attached to the client computer for reading the security device; and
 - a directory service accessed by the server-side cryptographic function, wherein
 - the server-side cryptographic function generates a challenge string,
 - the client-side cryptographic function generates a signed response string in response to the challenge string,
 - the custom script dynamically linked library encodes and divides the signed response string to obtain a plurality of packets,
 - the PKI-Bridge combines and decodes the plurality of packets to obtain a reconstructed signed response string, and
 - the server-side cryptographic function verifies the reconstructed signed response string to generate a result; and
 - the server-side cryptographic function sends an instruction based on the result to the server via the PKI-Bridge, wherein the instruction specifies whether the server should send an allow connection message to the remote access switch.

- 15. (Currently Amended) A client computer comprising:
 - a dial-up client providing dialing services to access for dialing a remote access switch, wherein the dial-up client executes on to the client computer;
 - a client-side cryptographic function providing cryptographic services located on the client computer; and
 - a custom script dynamically linked library providing an interface between the dial-up client and the client-side cryptographic function,
 - wherein the dial-up client is an executable file that loads and executes code in the custom

 script dynamically linked library, and wherein
 the client-side cryptographic function generates a signed response string, and

the custom script dynamically linked library encodes and divides the signed response string to obtain a plurality of packets.

- 16. (Previously Amended) The client computer of claim 15, further comprising:a security device reader attached to the client computer for reading a security device.
- 17. (Previously Presented) The client computer of claim 16, wherein the security device is a smart card.
- 18. (Previously Amended) The client computer of claim 15, wherein the custom script dynamically linked library comprises a SDLogin component and a SDSetupDial component.
- 19. (Original) The client computer of claim 15, wherein the dial-up client automates the authentication process using a hidden terminal operating in terminal mode.
- 20. (Currently Amended) A client computer comprising:
 - a dial-up client providing dialing services to access for dialing a remote access switch, wherein the dial-up client executes on to the client computer;
 - a client-side cryptographic function providing cryptographic services located on the client computer;

a custom script dynamically linked library providing an interface between the dial-up client and the client-side cryptographic function,

- wherein the dial-up client is an executable file that loads and executes code in the custom script dynamically linked library; and
- a security device reader attached to the client computer for reading a security device, wherein

the client-side cryptographic function generates a signed response string, and the custom script dynamically linked library encodes and divides the signed response string to obtain a plurality of packets.

- 21. (Currently Amended) A server comprising:
 - a server-side cryptographic function providing cryptographic services located on the server; and
 - a PKI-Bridge providing an interface between the server and the server-side cryptographic function, wherein

the server-side cryptographic function generates a challenge string,

- the PKI-Bridge combines and decodes a plurality of packets to obtain a reconstructed signed response string which is a response to the challenge string,—and
- the server-side cryptographic function verifies the reconstructed signed response string to generate a result; and
- the server-side cryptographic function sending an instruction to the server via the PKI-Bridge, wherein the instruction specifies whether the server should send an allow connection message to the remote access switch based on the result.
- 22. (Original) The server of claim 21, further comprising:a directory service accessed by the server-side cryptographic function.
- 23. (Currently Amended) A server comprising:a server-side cryptographic function providing cryptographic services located on the server;

a PKI-Bridge providing an interface between the server and the server-side cryptographic function; and

a directory service accessed by the server-side cryptographic function, wherein

the server-side cryptographic function generates a challenge string,

the PKI-Bridge combines and decodes a plurality of packets to obtain a reconstructed signed response string which is a response to the challenge string, and

the server-side cryptographic function verifies the reconstructed signed response string to generate a result; and

the server-side cryptographic function sending an instruction to the server via the PKI-Bridge, wherein the instruction specifies whether the server should send an allow connection message to the remote access switch based on the result.

24. (Currently Amended) A method of integrating via a dial-up interface, comprising:

sending session initiation information from a dial-up client to a PKI-Bridge, wherein the dial-up client is an executable file that loads and executes code in a custom script dynamically linked library;

checking session initiation information by the PKI-Bridge;

generating a challenge string by a server-side cryptographic function;

forwarding the challenge string to [[a]] the custom script dynamically linked library;

forwarding the challenge string to a client-side cryptographic function from the custom script dynamically linked library;

utilizing a private key from a security device;

generating a response string in response to the challenge string;

signing the response string with the private key of a dial-in user to obtain a signed response string;

forwarding the signed response string to the custom script dynamically linked library; encoding the signed response string to obtain an encoded signed response string; dividing the encoded signed response string into a plurality of packets;

forwarding the plurality of packets to the PKI-Bridge;

combining the plurality of packets to obtain a reconstructed encoded signed response string;

decoding the reconstructed encoded signed response string to obtain a reconstructed signed response string;

forwarding the reconstructed signed response string to the server-side cryptographic function;

obtaining a public key of the dial-in user; and

verifying the reconstructed signed response string based on the public key using the serverside cryptographic function to generate a result; and

Bridge, wherein the instruction specifies whether the server should send an allow connection message to the remote access switch based on the result.

- 25. (Previously Amended) The method of claim 24, further comprising: reading the security device by a security device reader.
- 26. (Cancelled)
- 27. (Cancelled)
- 28. (Original) The method of claim 24, further comprising: forwarding the challenge string to the dial-up client; and forwarding the challenge string to the PKI-Bridge.
- 29. (Previously Presented) The method of claim 24, further comprising: forwarding the plurality of packets from the custom script dynamically linked library.
- 30. (Original) The method of claim 24, wherein the security device is a smart card.
- 31. (Original) The method of claim 24, wherein the session initiation information comprises version information and a distinguished name.
- 32. (Original) The method of claim 24, wherein the public key is stored on a directory service.

33. (Original) The method of claim 32, wherein the directory service is lightweight directory access protocol compliant.

34. (Currently Amended) A method of integrating via a dial-up interface, comprising: sending session initiation information from a dial-up client to a PKI-Bridge, wherein the dial-up client is an executable file that loads and executes code in a custom script dynamically linked library;

checking session initiation information by the PKI-Bridge;

generating a challenge string by a server-side cryptographic function;

forwarding the challenge string to [[a]] the custom script dynamically linked library;

forwarding the challenge string to a client-side cryptographic function from the custom script dynamically linked library;

utilizing a private key from a security device;

generating a response string in response to the challenge string;

signing the response string with the private key of a dial-in user to obtain a signed response string;

forwarding the signed response string to the custom script dynamically linked library; encoding the signed response string to obtain an encoded signed response string;

dividing the encoded signed response string into a plurality of packets;

forwarding the plurality of packets to the PKI-Bridge;

combining the plurality of packets to obtain a reconstructed encoded signed response string; decoding the reconstructed encoded signed response string to obtain a reconstructed signed response string;

forwarding the reconstructed signed response string to the server-side cryptographic function;

obtaining a public key of the dial-in user; and

verifying the reconstructed signed response string based on the public key using the serverside cryptographic function.

reading the security device by a security card reader;

forwarding the challenge string to the dial-up client;

forwarding the challenge string to the PKI-Bridge; and forwarding the plurality of packets from the custom script dynamically linked library.

35. (Currently Amended) An apparatus of integrating via a dial-up interface, comprising:

means for sending session initiation information from a dial-up client to a PKI-Bridge, wherein the dial-up client is an executable file that loads and executes code in a custom script dynamically linked library;

means for checking session initiation information by the PKI-Bridge;

means for generating a challenge string by a server-side cryptographic function;

means for forwarding the challenge string to [[a]] the custom script dynamically linked library;

means for forwarding the challenge string to a client-side cryptographic function from the custom script dynamically linked library;

means for utilizing a private key from a security device;

means for generating a response string in response to the challenge string;

means for signing the response string with the private key of a dial-in user to obtain a signed response string;

means for forwarding the signed response string to the custom script dynamically linked library;

means for encoding the signed response string to obtain an encoded signed response string;

means for dividing the encoded signed response string into a plurality of packets;

means for forwarding the plurality of packets to the PKI-Bridge;

means for combining the plurality of packets to obtain a reconstructed encoded signed response string;

means for decoding the reconstructed encoded signed response string to obtain a reconstructed signed response string;

means for forwarding the reconstructed signed response string to the server-side cryptographic function;

means for obtaining a public key of the dial-in user; and

means for verifying the reconstructed signed response string based on the public key using the server-side cryptographic function to generate a result; and

means for sending an instruction to the server from the server side cryptographic function

via the PKI-Bridge, wherein the instruction specifies whether the server should send

an allow connection message to the remote access switch based on the result.
